Methodology

Likely voters were selected at random from a list of registered voters based on specific election participation and registration date. Household ages and locations were extracted as well from this list. In excess of 80,000 households were contacted over the duration of the poll. Automated calls were used to contact a majority of participants, while live and online surveys were used to enrich the voter sample.

A mixture of automated voice response technology, live, and online interviews are used in order to identify and compensate for possible social desirability bias. Calls are placed to randomly-selected phone numbers through a stratified process that insures appropriate geographic representation. These calls were placed from 6:00pm to 8:30pm local time from Wednesday, November 29th though Saturday, December 30th.

Survey results undergo a weighting process to ensure the sample is comparable to the demographic breakdown of expected 2018 South Carolina general election participants. Final results are based on these weights in order to address non-response bias.
